

# SAVE 4,000 LITRES OF WATER A YEAR- WITHOUT SPENDING A PENNY

Did you know that you could save 4,000 litres of water a year simply by putting a one litre plastic bottle full of water in your toilet cistern?

It really is as simple as that.

And, if every household in the Bristol Water area did the same it could save 2,000 million litres in a year! Efficient use of this precious resource helps to protect the environment and keep prices down.

How does the bottle work? Well, it acts as a displacement device, cutting down on the amount of water that sits in your cistern between flushes. Many cisterns use at least 9 litres of water per flush, but they don't always need all that water to flush effectively.\*

There are lots of different displacement devices on the market. In the end, though, the humble plastic bottle does the job as well as most and is a lot easier to fit. And you don't have to spend a penny to do it!

So, if you want to save water, the solution is in your hands... or in your bin.

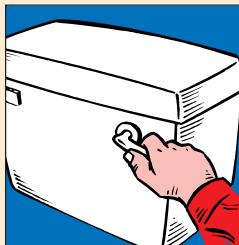

## FITTING INSTRUCTIONS

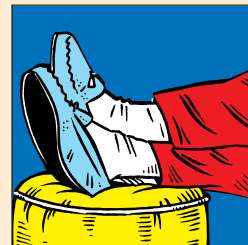

1. Rinse out and fill 1 litre plastic bottle with tap water. Remove label. replace cap.

2. Place in cistern, ensuring the workings aren't obstructed.

3. Flush to check that cistern works efficiently.

4. After all that hard work have a rest!

\* Displacement devices like this may not work in newer toilets which only use 6 litres of water. If a 1 litre bottle is too big, try a smaller one.
